PropRent — UI/UX Handoff Document

Design brief for Figma | Based on Requirements Gathering v1.0 and System Analysis & Design Draft 1.0

Prepared as a handoff brief for the UI/UX designer. Requirements remain the source of truth.

Source documents: PropRent Requirements Gathering Specification v1.0; PropRent System Analysis & Design Draft 1.0.

1. Purpose and source of truth

This document gives the UI/UX designer a practical starting point for designing PropRent. The primary source of truth is the PropRent Requirements Gathering Specification v1.0. The System Analysis & Design document provides supporting workflows, logical models, and a proposed screen inventory.

If a screen idea conflicts with the requirements, follow the requirements and flag the conflict for the team. Do not invent business rules, providers, payment methods, brand decisions, or features that have not been approved.

The current brand colours, typography, and final visual direction are not fixed in the source documents. Any proposed palette or styling should be presented as a proposal for team approval.

2. Product overview

PropRent is a Property Rental Management & Tenant Portal Platform. It brings property and unit listings, applicant enquiries, tenant onboarding, leases and documents, rent billing and payments, maintenance requests and work orders, communication, notifications, and reporting into one coordinated system.

Design for clear task completion, role-appropriate information, trust around financial and lease data, and traceable maintenance progress.

3. User roles and access boundaries

Prospective tenant / applicant: browse public listings, view listing details, submit an enquiry, and receive acknowledgement.

Tenant: view their lease and documents, invoices and payment status, receipts, autopay settings where in scope, submit and track maintenance requests, and use authorised messaging/notifications.

Property manager / leasing agent: manage properties and units, listings, applicant enquiries, tenant onboarding, lease/signature workflows, invoices and collections, maintenance triage and work-order assignment, communications, and reports.

Property owner / landlord: view only the properties and financial information they are authorised to access; review income, expenses, occupancy and arrears; export reports; review work requiring owner approval when the configured threshold is exceeded.

Maintenance contractor / vendor: view assigned jobs only, see necessary job/access details, update job status, upload completion photos, and submit final cost/invoice information.

Platform administrator: invite/manage users, assign roles, activate/deactivate accounts, and review audit records/configuration.

Use role-based navigation and enforce access boundaries in the design. Do not show tenant, owner, or financial records outside the relevant authorised scope.

4. Priority user flows to prototype

Flow A — Public listing enquiry: Search listings → filter results → listing details → enquiry form → validation/success acknowledgement. Include empty search results and validation errors.

Flow B — Tenant rent payment: Tenant dashboard → invoices → invoice details → review amount and due date → payment step → pending/success/failure outcome. Show a receipt only after successful payment confirmation. Do not imply that a payment integration is live in a visual prototype.

Flow C — Maintenance request: Tenant portal → new request → category/description/urgency/preferred access slots → attach up to five files as stated in the use case → submit → confirmation with ticket reference → ticket details/status history. Preserve entered data when validation fails.

Flow D — Lease renewal and e-signature: Tenant/manager sees lease status → review renewal document → required signers and signature progress → completed status only after all required signatures are complete. Keep the exact provider and signing implementation undecided.

Flow E — Manager work-order handling: Manager reviews new ticket → triages/prioritises → assigns an approved contractor → owner approval step if estimated cost exceeds the configured threshold → contractor updates progress → completion evidence/final cost → manager verifies/closes according to confirmed business rules.

Flow F — Owner reporting: Owner dashboard → choose date range → view income/expenses/net income, occupancy and arrears → export PDF/CSV where required. Restrict results to the owner's authorised property scope.

Flow G — Admin user management: User list → invite user → assign role → activate/deactivate account → confirm result; audit-sensitive actions should be represented clearly.

5. Screen inventory

PUBLIC / APPLICANT

- Public listings/search and filters
- Listing details
- Applicant enquiry form
- Enquiry acknowledgement / confirmation

SHARED AUTHENTICATION AND PROFILE

- Sign in
- Account invitation/activation or password setup (align exact flow with implemented authentication)
- User profile / account settings

TENANT PORTAL

- Tenant overview/dashboard
- Lease details and status
- Documents
- Invoices and payment history
- Invoice details / payment step
- Payment result and receipt
- Autopay settings (if included in the approved scope)
- Maintenance requests list
- New maintenance request form
- Ticket details and status history
- Messages / conversation view
- Notifications

PROPERTY MANAGER / LEASING AGENT

- Portfolio dashboard
- Properties list and property details
- Units list and unit details
- Create/edit listing
- Applicant/enquiry queue
- Applicant/enquiry details
- Tenant onboarding and lease management
- Lease signers / signature progress
- Invoices and collections
- Maintenance triage queue
- Work-order details and assignment
- Announcements/messages
- Reports

PROPERTY OWNER / LANDLORD

- Owner-scoped dashboard
- Income, expenses and net-income report

- Occupancy and arrears report
- Date-range filter and PDF/CSV export
- Work-order approval queue for costs above threshold

CONTRACTOR / VENDOR

- Assigned jobs list
- Work-order details and relevant access information
- Update job status
- Upload completion photos
- Submit final cost/invoice information

PLATFORM ADMINISTRATOR

- User management
- Invite user
- Assign/update role
- Activate/deactivate account
- Audit log
- Configuration only where defined/approved

Screen count may be reduced by using tabs, drawers, or modals where that improves usability. Do not omit distinct success, error, pending, or permission states merely to reduce screen count.

6. Design system and responsive requirements

Start with a consistent shared component library before scaling to all screens. Include colour and typography tokens, spacing, grid/layout, border radius, elevation, icon style, form controls, buttons, cards, badges/status labels, tables, pagination, dialogs/drawers, navigation, breadcrumbs, notification patterns, and file-upload controls.

Use Auto Layout and reusable components/variants in Figma. Create clear component states: default, hover, focus, disabled, loading, error, and success where relevant.

Responsive requirement: mobile-first interface supporting viewport widths from 320 px through 2560 px. Key tenant tasks must remain usable on a smartphone. Provide desktop layouts for operational dashboards and mobile layouts for critical tenant actions.

Accessibility target: WCAG 2.1 AA. Maintain text contrast of at least 4.5:1 for normal text and 3:1 for large text; touch targets should be at least 44×44 px; provide visible keyboard focus and clear labels.

Use plain-language inline validation and feedback for long-running actions. Preserve entered form data after validation errors. Include empty, loading, error, success, pending, and no-permission states where relevant.

Suggested starting frames: desktop 1440 × 1024; mobile 390 × 844; also test narrow mobile around 320 px. These are design working sizes, not fixed product constraints.

Suggested visual direction only (requires team approval): restrained navy/blue, white surfaces, and light-gray backgrounds. Do not treat any unapproved hex colours, fonts, or branding as a final requirement.

7. Content and data display guidance

Use realistic sample data for visual demonstration, but label it as sample/demo data and do not present it as production data.

Financial views should clearly separate invoice amount, due date, amount paid, outstanding balance, payment status, and receipt availability where these fields are supported by the workflow.

Maintenance views should make ticket reference, unit/property context, urgency/priority, current status, submitted date, and status history easy to scan.

Property/unit listings should clearly distinguish property-level information from unit-level information and show availability/status without implying unsupported fields.

Use consistent, plain-language status labels. Confirm the final status vocabulary with the implementation team because the analysis document identifies some state labels as a proposal.

8. Prototype and handoff deliverables

Figma file organised into pages such as: 00 Overview, 01 User Flows, 02 Wireframes, 03 Design System, 04 High-Fidelity UI, 05 Prototype.

A screen inventory mapped to user roles and priority flows.

Low-fidelity wireframes for the priority flows before polishing all screens.

Approved design tokens and reusable components with documented variants.

High-fidelity responsive screens for agreed priority flows.

Clickable prototype linking the priority flows and showing key alternate states.

Handoff notes for each important screen: purpose, user role, entry point, main action, validation, success/failure states, and relevant access restrictions.

A short list of open questions/decisions for the team rather than silently guessing.

9. Suggested order of work

1. Read the Requirements Gathering Specification and System Analysis & Design document.
2. Confirm role-specific access and the priority flows with the team.
3. Finalise screen inventory and information architecture.
4. Produce low-fidelity wireframes for the priority flows and review them.
5. Propose and approve the design system.
6. Create high-fidelity screens using reusable components.
7. Build the clickable prototype and test the main flows on desktop and mobile.
8. Deliver the Figma link, component library, prototype link, and open-decision list.

10. Decisions to confirm before final UI

Final brand palette, typography, logo usage, and visual direction.

Exact sign-in/account activation and password-reset flow supported by the chosen platform.

Whether autopay is included in the implemented scope and which payment methods are supported.

Final payment states and what information can appear on receipts.

Exact maintenance status vocabulary, cancellation/reopen rules, and owner-approval threshold behaviour.

Whether messaging supports attachments and which attachment types are allowed.

Final language(s) at launch and the RTL implementation approach. The requirements call for English plus one additional language and RTL readiness; confirm the actual language choice.

Which reports and export formats are Must Have versus later-phase items; preserve Must/Should/Could/Won’t priorities from the requirements.

Any low-code/no-code platform constraints that affect responsive layouts, components, tables, or interactions.

11. Scope guardrails

Keep the 7 functional epics and their priority labels from the Requirements Gathering Specification as the baseline.

Do not implement or design Won’t Have features as committed scope. Should/Could items should be visibly treated as optional or later phase until approved.

The Figma prototype is a representation of intended behaviour; do not imply that backend, payment, e-signature, notifications, or file storage integrations are functional unless verified by the implementation team.

The System Analysis & Design document is Draft 1.0 and labels some details as proposed/TBD. Use those details as discussion points, not as final decisions.

Quick checklist for the designer

- Confirm user roles and access boundaries.
- Agree on priority flows and screen inventory before high-fidelity design.
- Review wireframes before styling.
- Use reusable components and document variants.
- Check WCAG 2.1 AA contrast, focus, and touch targets.

- Include empty, loading, error, success, and pending states.
- Mark sample data as demo data.
- Share Figma file and clickable prototype with the team.
- Record unresolved decisions instead of guessing.
